

CODELAB PROJECT 2

EXPLORATORY DATA ANALYSIS (EDA)

Tool Used: Microsoft Excel

1. Project Objective

The objective of this project was to perform Exploratory Data Analysis (EDA) on the cleaned dataset using Microsoft Excel. The analysis focused on understanding the data through descriptive statistics, identifying trends, detecting outliers, and summarizing key observations.

2. Dataset Description

The dataset used for this project contains 1,200 records and 14 columns. It includes information such as Order ID, Date, Customer ID, Product, Quantity, Unit Price, Shipping Address, Payment Method, Order Status, Tracking Number, Items in Cart, Coupon Code, Referral Source, and Total Price.

3. Analysis Process

The analysis was carried out using Microsoft Excel. Descriptive statistics were calculated for Quantity, Unit Price, Items in Cart, and Total Price, including the mean, median, minimum, maximum, and count. A PivotTable and line chart were used to examine the trend in Total Price over time. A box-and-whisker chart was also used to identify unusual values and outliers in Total Price.

4. Key Observations

The analysis showed that the average quantity per order was approximately 2.95, with a median of 3. The quantity values ranged from 1 to 5.

The TotalPrice trend showed changes in sales value across the different months, indicating variations in order revenue over time.

The box-and-whisker chart identified an unusually high TotalPrice value of 3,456.40 as an outlier. This indicates that at least one order had a considerably higher total price than most other orders.

5. Conclusion

Type:

The exploratory data analysis was successfully completed using Microsoft Excel. Descriptive statistics were used to understand the distribution of the numerical variables, while trend analysis helped examine changes in TotalPrice over time. The box-and-whisker chart also helped identify

an unusually high TotalPrice value. Overall, the analysis provided useful insights into the dataset and prepared it for further analysis.
